aicram PDF QA

Linux quick guide | Created for Marcia Wilbur

What the app does

Checks a finished PDF against four values you enter: **ECN/control number, part number, document title, and revision.** It flags missing, unrecognized, or mismatched fields and identifies the affected page. The app runs locally and leaves your PDF unchanged.

Install and start

1. Download **aicram-pdf-qa-linux.zip** and extract it. Open the extracted **aicram-pdf-qa** folder in a terminal.

2. On Ubuntu, Debian, or Linux Mint, install the requirements once:

```
sudo apt install python3 python3-tk poppler-utils
```

3. Start the application:

```
python3 pdf_qa.py
```

Check your document

1. Click **Browse** and select your PDF.
2. Enter the expected **ECN, part number, title, and revision**.
3. Click **Check PDF**.
4. Review the page-specific findings. Click **Save report** to save a text or JSON report.

Choose the checking scope

Require all four fields on every page is selected by default. Uncheck it if your template omits fields on some pages. Each field must still be found somewhere, and all recognized occurrences must match.

By default, the app searches the entire cover page and the top/bottom quarter of later pages. Select **Search entire pages** if identifiers appear elsewhere. Body references and revision-history entries within the search scope can be flagged.

Recognizable fields and PDF text

Use labels such as **ECN: ECN-12345**, **Part Number: PN-100**, **Title: Installation Manual**, and **Revision: C**. Labels need a colon or equals sign, with the value on the same extracted line. An unlabeled title can also match complete lines. Case and repeated whitespace are ignored.

Try selecting and copying text in the PDF. Scanned/image-only PDFs need OCR before checking; OCR is not included. A page with no extractable text fails, including a blank page.

What PASS means

PASS means the recognized fields matched within your selected scope. It does not verify visual layout, ECN authorization, or regulatory approval. Test the app against your actual document templates before replacing the manual document-control checkpoint. Reports include expected values, a timestamp, and the PDF fingerprint; no source-file corrections are made.
